

5 charges,  $q$ , are arranged in a regular pentagon, as shown.  
What is the E field at the center?

- A. Zero
- B. Non-zero
- C. Really need trig and a calculator to decide

1 of the 5 charges has been removed, as shown. What's the E field at the center?

- A.  $+(kq/a^2)\hat{y}$
- B.  $-(kq/a^2)\hat{y}$
- C. 0
- D. Something entirely different!
- E. This is a nasty problem which I need more time to solve

If all the charges live on a line (1-D), use:

$$\lambda \equiv \frac{\text{charge}}{\text{length}}$$

Draw your own picture. What's  $\mathbf{E}(\mathbf{r})$ ?

$$\mathbf{E}(\mathbf{r}) = \frac{1}{4\pi\epsilon_0} \int \frac{\lambda d\mathbf{l}'}{\mathcal{R}^2} \hat{\mathcal{R}}$$

What is  $\mathcal{R}$ ?

- A.  $x$
- B.  $y'$
- C.  $\sqrt{dl'^2 + x^2}$
- D.  $\sqrt{x^2 + y'^2}$
- E. Something else

$$\mathbf{E}(\mathbf{r}) = \int \frac{\lambda d\mathbf{l}'}{4\pi\epsilon_0 \mathcal{R}^3} \hat{\mathcal{R}}, \text{ so: } E_x(x, 0, 0) = \frac{\lambda}{4\pi\epsilon_0} \int \dots$$

- A.  $\int \frac{dy'x}{x^3}$
- B.  $\int \frac{dy'x}{(x^2 + y'^2)^{3/2}}$
- C.  $\int \frac{dy'y'}{x^3}$
- D.  $\int \frac{dy'y'}{(x^2 + y'^2)^{3/2}}$
- E. Something else

What do you expect to happen to the field as you get really far from the rod?

$$E_x = \frac{\lambda}{4\pi\epsilon_0} \frac{L}{x\sqrt{x^2 + L^2}}$$

- A.  $E_x$  goes to 0.
- B.  $E_x$  begins to look like a point charge.
- C.  $E_x$  goes to  $\infty$ .
- D. I can't tell what should happen to  $E_x$ .

### Activity:

You determine that a particular electrostatics problem cannot be integrated analytically. How do you instruct a computer to do it for you?

Work with those around you to come up with a series of instructions (in plain words) to tell the computer to do it.

Given the location of the little bit of charge ( $dq$ ), what is  $|\vec{\mathcal{R}}|$ ?

- A.  $\sqrt{z^2 + r'^2}$
- B.  $\sqrt{z^2 + r'^2 - 2zr' \cos \theta}$
- C.  $\sqrt{z^2 + r'^2 + 2zr' \cos \theta}$
- D. Something else
